Abstract

19 The UP System started deployment of RFID/NFC-enabled UP ID in 2019. After
20 several years since deployment, we have yet to see a system that fully utilizes
21 the technology embedded in the UP ID. In particular, we see a great potential in
22 using it as an access key for tracking the attendance of students in their classes.
23 Professors currently either use the traditional pen and paper or a spreadsheet
24 in their laptops to check for attendance. The mentioned practices are prone to
25 forgery and takes precious time away from the class period.

26 Our paper proposes a fully digital attendance tracking system that can be used
27 by professors to record the attendance of their students in real time. The system
28 uses UP ID and facial recognition for a two-layer validation process ensuring ac-
29 curacy of the records. Facial recognition uses a pretrained Facenet model that
30 surpasses human beings in multiple facial recognition tests for accuracy. The pro-
31 posed system allows the students to check in by tapping their ID to the RFID/NFC
32 reader, and aligning their face in the camera. The current prototype takes only
33 about 2-3 seconds per student to complete the whole validation and recording
34 process, with more room for optimizations down the line.

35 **Keywords:** UP System, RFID, attendance, machine learning, facial
recognition, Facenet model.

Chapter 1

Introduction

1.1 Overview

Attendance plays an important role in improving the academic performance of students. There is evidence that students with lower attendance often have lower grades (Ancheta, Daniel, & Ahmad, 2021). Therefore, attendance is usually enforced and recorded at most higher education institutions. However, the systems in place for recording attendance are typically manual and time-consuming.

The traditional pen and paper attendance system has existed since the invention of paper itself. It is used for time keeping by manually writing or checking the “present” status in a paper log book. Manually writing names takes an average of 17 seconds per student (Shoewu, Makanjuola, & Olatinwo, 2014), and for class size of 30 students that leads to approximately 8 minutes of class time wasted. While it is recognized that such system is time-consuming and wastes resources, it persisted because of its familiarity. Going to class means bringing pen and paper for most students and teachers alike, so using the same material for recording attendance seemed the most practical.

In recent years, as laptops and portable computers became more accessible, some faculty of UP started transitioning to digital spreadsheets provided by services like Microsoft Excel. While it seemed to have moved the traditional pen and paper towards digitalization, another problem arises as this required manually roll calling students to say “present”. It had the same problem of being a manual process. It is easily disrupted by a noisy class. Some time that was supposed to be utilized for immediate teaching was used for roll call.

Both systems mentioned are prone to errors and unnecessarily increases administrative burden for the faculty. Reduction in teaching time means frequently moving the lesson discussions by the faculty, with some topics being rushed or skip entirely by the end of semester. This reduces overall the quality of education students received and may negatively impact their readiness for subsequent courses they may take.

It is also useful to analyze the traditional attendance methods from the lens of CIA triad since we are dealing with information security. It is a guiding model comprised of 3 key principles: Confidentiality - the protection of data from unauthorized access. Integrity - prevent that data from tampering. Availability - data is present whenever you need them (Cawthra et al., 2020). The traditional pen and paper violates confidentiality as there no strict restrictions on who accesses the paper for keeping the attendance data. As a consequence, integrity is also violated as anyone with a pen can easily modify attendance records. Availability also cannot be ensured since paper as a storage medium is easily destructible via wear or tear. Replacing paper with digital counterparts such as Microsoft Excel might address these violations, although indirectly. Teachers put passwords on their laptops, but no authentication is done for the Excel file itself unless it is explicitly encrypted. The file is also prone to accidental deletion.

Therefore, we propose a fully automatic, digital attendance system that addresses these concerns. We utilize the already distributed UP ID and pretrained face recognition models that ensures an easy, accurate, attendance keeping. It aims to ease the burden of faculty and students from manual methods of attendance system, allowing them to focus on class discussions instead.

1.2 Problem Statement

The current methods of taking attendance today such as the manual call roll, biometrics, and online or remote attendance provides challenges in terms of efficiency, security, and authenticity. Manual roll calls are time consuming, according to (Mahato & Suman, 2013, p. 5875), it consumes an average of 5 to 15 minutes in order to complete an attendance using manual roll call attendance. It also provides a burden to some of the teachers through the disruptive behaviors of the students which lower the efficiency of manual roll call ("How Teachers Can Meet the Challenges," 2015). Biometrics attendance systems like fingerprint and facial scanning provide efficiency in taking an attendance but it is more costly and widely not accessible. The online or remote attendance system is only advisable in virtual class and not in face to face class as it is prone to attendance fraud.

136 Failure to resolve efficiency and a secured attendance system may lead to
137 inaccurate attendance records and high risks of attendance fraud. These gaps
138 may also affect the integrity in terms of attendance of the university. To fill
139 those gaps, the solution should be the integration of RFID and facial recognition
140 technology but there are uncertainties which are the efficient ways to integrate
141 the real-time face capture while managing the privacy concerns and also finding
142 an optimal way to gather sensitive information which are the student's biometric
143 and their RFID serial number.

144 Given the gaps of the current attendance system method, there is a need to
145 design an attendance system with the integration of RFID and facial recognition
146 technology which are:

- 147 1. Efficiently captures the real-time data using the RFID and facial recognition
148 technology.
- 149 2. Ensure and maintain security and privacy of the student's sensitive data
150 such as their facial biometrics and unique serial number of their RFID.
- 151 3. Ensure compatibility with the university infrastructure which is the avail-
152 ability of RFID and the hardware for facial scanning.
- 153 4. Determine the effectiveness of the combination of the RFID and facial tech-
154 nology in the attendance system.

155 **1.3 Research Objectives**

156 **1.3.1 General Objective**

157 This project aims to develop a web application that effectively uses the current UP
158 RFID and face recognition for attendance checking and recording in the University
159 of the Philippines Visayas. Additionally, it also aims to assess the performance of
160 the application in terms of accuracy and efficiency.

161 **1.3.2 Specific Objectives**

- 162 1. To develop a full stack web application that uses an RFID scanner and facial
163 recognition models such as Facenet for an accurate and efficient tracking of
164 student attendance.

- 165 2. To enhance application security by implementing the principles of Confiden-
166 tiality, Integrity, and Availability.
- 167 3. To analyze the application's performance based on metrics such as accuracy,
168 efficiency and security.

169 1.4 Scope and Limitations of the Research

170 The focus of this project is to create an attendance system that uses RFID together
171 with facial technology. This project will take real time attendance by scanning
172 the student's RFID and verify the student's identity using facial technology. The
173 project will also focus on the User Experience part where students can take their
174 attendance as quickly as possible by aligning their faces while they scan their
175 RFIDs. In that way it will enhance the overall efficiency and accuracy of taking
176 attendance in the university.

177 This project will not involve the training of face recognition models, as there
178 are high-performance, pretrained models readily available. The focus will be on
179 utilizing these existing face recognition models for the development of an effective
180 attendance tracking system. This project will only limit face to face classes, it
181 will not cover the virtual or online classes, it will also not cover the other forms
182 of biometric authentication such as fingerprint and eyes (iris scanning) because of
183 its expensive hardware and the privacy concerns of the students.

184 1.5 Significance of the Research

185 Facial recognition has been in use mobile applications for validation of identity
186 and the performance has significantly improved over the years. This allowed us to
187 explore the possibility of using it in attendance tracking of students in UP Visayas
188 as there are currently no system like it in place. We also intend for this project to
189 be open-source. Some of the people that will benefit from our developed app are:

- 190 • Students - will benefit from the increased class time. This allow better
191 retention of topics and lesson discussions. This complements the goal of
192 recording attendance itself, which is to increase the quality of education the
193 students receive.

194 • Faculty - will also benefit from the increased class time. An automated
195 system will allow them to focus entirely on delivering the topics that need
196 to be covered. It will lessen the possibility of skipping modules or topics
197 needed by students to learn before taking their subsequent courses.

198 • UP System - Since the UP RFID are used across all constituent units of the
199 UP System, our project can be used by any faculty under the UP System.
200 They may also choose to create their own version as long as they also make
201 it open source, as stipulated in GNU GPLv3 license.

202 • Society benefits - this project is significant in our society. The project is
203 scalable and when it is improve more in the future, there is a high possibil-
204 ity that it can be applicable not only to tertiary, higher or in any education
205 but also it will be applicable to large organizations or corporations as it can
206 improve taking attendance plus it can reduce the fraud in taking attendance
207 because one of the gaps to be filled by this project is the integrity, the com-
208 bination of RFID and the real-time face capture can help the organizations
209 to have integrity in terms attendance.

210 We also hope that this project will bring focus on the growing accessibility
211 of facial recognition technologies and inspire the community to explore on how it
212 can be incorporated their own projects.

Chapter 2

Review of Related Literature

2.1 Importance of Attendance Tracking

Attendance has become increasingly important in every organization, institution, and workplace to ensure accountability, productivity, and engagement. For example, in schools, it ensures that students are present, participating, and fulfilling their responsibilities. Taking students' attendance is important for monitoring their performance in class. Good attendance is usually linked to good class performance, and vice versa (Zhi, Ibrahim, & Aris, 2014).

2.2 Attendance Tracking Methods

There are various methods to track classroom attendance, from traditional manual approaches, such as roll call or pen-and-paper methods, to modern technology-based systems, including biometric like fingerprint or facial recognition. The advantages and disadvantages of these systems will be discussed in the following subsections using the CIA Triad.

The Confidentiality, Integrity, and Availability (CIA) Triad is a commonly used information security model that helps organizations develop secure systems (Fruhlinger, 2024). Confidentiality refers to the protection of information from unauthorized access to ensure that only authorized users can access or modify data. Integrity ensures that data remains complete, trustworthy, and unaltered by unauthorized users, whether accidentally or maliciously. Availability ensures that authorized users can access the data when needed. These three principles

235 are often used to identify vulnerabilities in a system.

236 **2.2.1 Traditional Attendance Tracking Methods**

237 The traditional method of taking attendance is through a manual roll call. Ac-
238 cording to Uniyal (2022), using manual attendance is cost-effective, simple to use,
239 and remains functional during power interruptions. However, despite these ad-
240 vantages, manual attendance has several flaws. For instance, the roll call method
241 is time-consuming as it can waste 5 to 15 minutes of class time which could other-
242 wise be spent on actual learning (Mahato & Suman, 2013, p. 5875). Additionally,
243 there is a problem in integrity when ledger sheets are used as it is easy for stu-
244 dents to fake another student's attendance by forging their name and signature
245 or erasing an already marked attendance.

246 CIA Triad Analysis:

- 247 • Confidentiality: Traditional attendance tracking methods may offer low con-
248 fidentiality as attendance can easily be accessed by unauthorized individuals,
249 especially with the pen-and-paper method.
- 250 • Integrity: Traditional attendance tracking methods have low integrity as it
251 is easy for students to forge another student's attendance or alter existing
252 records.
- 253 • Availability: Traditional attendance tracking methods have high availability
254 as attendance can always be taken during class, regardless of technological
255 failures.

256 **2.2.2 Biometric-Based Attendance Systems**

257 According to (Truein, 2024), there is another one that is more reliable and has
258 a higher accuracy than the fingerprint biometric attendance system and that is
259 facial recognition. According to (Yang & Han, 2020), with the use of real time
260 video processing, it can result in a high accuracy for about 82% which is higher
261 compared to other attendance systems. It can also reduce the truancy rates in
262 school as the facial recognition system can easily identify who gets in and out in
263 real time, preventing the students from cutting classes or even skipping classes.
264 Biometric systems such as fingerprint recognition have addressed some of the
265 shortcomings of manual attendance methods. According to Walia & Jain (2016),

266 replacing traditional attendance methods with biometric fingerprint systems im-
267 proves confidentiality and integrity. However, while biometric fingerprint atten-
268 dance systems have high reliability, they still come with some limitations (Truein,
269 2024). For example, if a person’s finger is injured or dirty, the system may fail
270 to recognize the fingerprint which can affect the system’s effectiveness. Moreover,
271 the cost of deployment can be high due to the need for specialized hardware and
272 maintenance.

273 CIA Triad Analysis:

- 274 • Confidentiality: Biometric systems provide better confidentiality compared
275 to manual methods as biometric data is unique to each individual and stored
276 securely. However, if the data is compromised, the consequences can be
277 severe because biometric data cannot be changed, unlike passwords.
- 278 • Integrity: Biometric systems provide high integrity as it is almost impossible
279 to forge or alter fingerprint data.
- 280 • Availability: While biometric systems are generally available, they may face
281 limitations if the finger is injured or dirty or in areas with an unreliable
282 power supply.

283 Facial recognition technology has emerged as an even more accurate and con-
284 venient alternative to fingerprint systems (Truein, 2024). According to Yang &
285 Han (2020), real-time video processing in facial recognition systems has an accu-
286 racy rate of about 82%, which is higher than other attendance tracking methods.
287 Facial recognition can also help reduce truancy rates by identifying students in
288 real time in order to prevent them from skipping classes.

289 CIA Triad Analysis:

- 290 • Confidentiality: Facial recognition systems, like fingerprint systems, have
291 high confidentiality as biometric data is unique to each individual and stored
292 securely.
- 293 • Integrity: The integrity of facial recognition systems is typically high as it
294 is difficult for students to falsify their identity without being detected.
- 295 • Availability: Facial recognition systems are generally highly available, par-
296 ticularly in environments with stable lighting conditions.

2.3 Chapter Summary

This chapter discussed various classroom attendance tracking methods and analyzed their advantages and disadvantages using the CIA Triad. Traditional manual systems, while cost-effective, lack both confidentiality and integrity. Fingerprint systems offer better security but may suffer from availability issues when the finger is dirty or injured. Facial recognition systems, with higher accuracy and efficiency, provide significant improvements in terms of data confidentiality and integrity.

A table comparing these systems, based on the CIA Triad, is provided below:

| Attendance Tracking Method | Confidentiality | Integrity | Availability |
|----------------------------|-----------------|-----------|--------------|
| Traditional | Low | Low | High |
| Fingerprint Systems | High | High | Medium |
| Facial Recognition Systems | High | High | High |

Table 2.1: Comparison of Attendance Tracking Methods Using the CIA Triad

Our proposed system aims to leverage the security advantages of Facial Recognition Systems by adding an extra layer of user authentication that requires students to use their UP RFID which is personal and unique to each student.

Chapter 3

Research Methodology

This chapter lists and discusses the specific steps and activities that will be performed to accomplish the project. The discussion covers the activities from pre-proposal to Final SP Writing.

3.1 Research Activities

This project aimed to create an automated attendance system with the help of RFID together with facial recognition technology. This attendance system will replace and reduce the usage of manual attendance such as the written and oral and enhance its lacking optimized features such as security, reliability, authenticity, and integrity using the student's RFID and facial biometric.

The proposed system is expected to function by tapping the RFID of the students with real time facial capture through face recognition technology. The identity of the students will be verified through the unique serial number of their RFID that will match from the system database while the face recognition will serve as the two-factor authentication. The face recognition is expected to work by capturing the students face then will be matched also through the system database. The attendance will only be valid once both student's unique serial number in their RFID and their face has been verified.

To make the system functional, several data from the students need to be collected. Those are the student's name, student number, student's unique serial number of their RFID, and their facial biometrics. Those data will be gathered either online or face to face. Students are encouraged to download any of the RFID

331 card readers to know their RFID's serial number but in case they are incapable of
332 doing that. Face to face to face will be an option where we can provide a physical
333 RFID card reader. The facial recognition data will be gathered through capturing
334 their image or video to be more accurate.

335 The hardware components will be using in this system are: RFID scanner:
336 Which will be used to read the RFID given to the students. This will also be
337 responsible for taking the students unique serial number on their RFID ensuring
338 the integrity of the students. USB connector: This will be used to connect the
339 RFID scanner to the Laptop or Raspberry Pi. Flex cable: This will be used to
340 connect the Raspberry Pi Vision Camera to Raspberry Pi. Laptop / Raspberry
341 Pi: This will serve as the main processing unit. The laptop or raspberry pi will be
342 used for running the required algorithm to make the face recognition and read the
343 RFID correctly. Overall, the laptop / raspberry pi will be in charge of handling
344 the data. Raspberry Pi Vision Camera: In charge of capturing the student's
345 facial image while scanning the RFID to the RFID scanner. Software Python
346 facial recognition

347 **3.2 Hardware Development Tools**

348 Our current prototype uses hardware components that are commonly used in the
349 industry to build an integrated system. All of the tools are readily available.
350 These include but are not limited to:

- 351 • RFID Scanner - Used as a reader for the RFID. The RFID scanner allows us
352 to have secured and efficient way of identifying the student's unique serial
353 number.
- 354 • Raspberry Pi Vision Camera - A camera module for Raspberry Pi hardware
355 that allows us to capture the student's facial image while scanning the RFID
356 with the use of RFID scanner.
- 357 • Raspberry Pi - Serves as the main processing unit which allows us to inte-
358 grate the other hardware together with the necessary software.
- 359 • USB Connector - Serves as connector for the RFID scanner and Raspberry
360 Pi.

- 361 • Flex Cable - Serves as connector for the Raspberry Pi Vision Camera and
362 Raspberry Pi.

363 3.3 Software Development Tools

364 Our current prototype include these frameworks and tools that are heavily used
365 in the industry for rapid development and deployment of web applications. All of
366 the tools used are open source. These include but are not limited to:

- 367 • Django - The web framework for perfectionists with deadlines. Django,
368 which serves as the backend server, allows us to interface with the database
369 server to do queries in the Python using Django's Object Relational Mapping
370 tool(ORM). We can easily integrate popular pretrained facial recognition
371 models as they are typically written in Python.
- 372 • deepface Python library - Provides the face verification tool and anti-spoofing
373 capabilities. It wraps the popular face recognition models into an easy to
374 use library. These include but is not limited to: Facenet, VGG-Face and
375 OpenFace.
- 376 • Django Ninja - Creates the REST API on top of our Django backend to
377 allow the frontend to consume the backend content.
- 378 • NuxtJS - The frontend JavaScript framework used to build our web interface.
379 Includes all the tools for routing, quering, and security. By default, it renders
380 our web interface in Server Side Rendering(SSR) mode. Most of the work
381 happens in the server and no authentication tokens are stored in the client
382 browser. This increases security since authentication tokens are only added
383 in the server side per request.

Chapter 4

Preliminary Results/System Prototype

4.1 System Architecture

Using the tools mentioned in Section 3.3, our system can be visualized as shown in Figure 4.1:

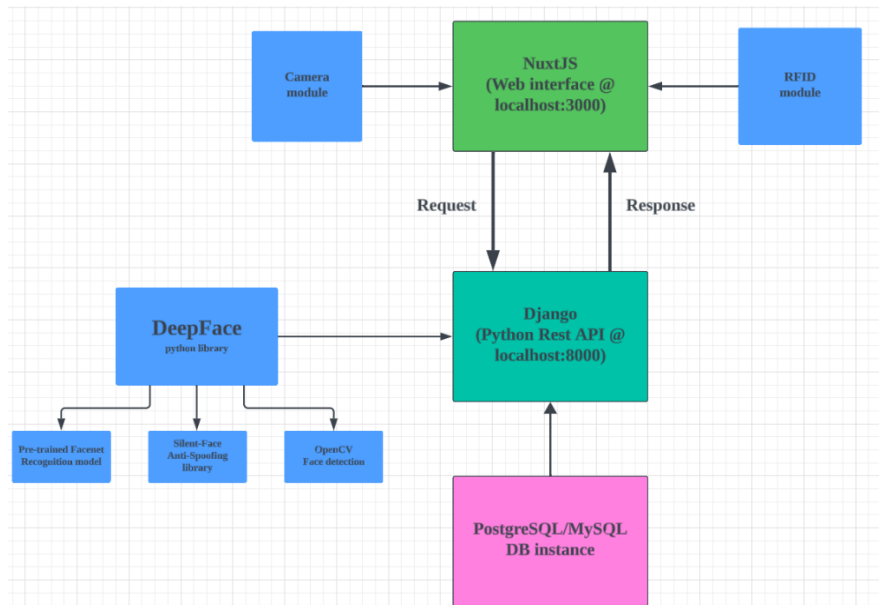

Figure 4.1: System Architecture

390 4.2 Django Backend

391 4.2.1 Models

392 Django Model class maps to SQL tables. For example, a Student table will have
393 the following columns which maps to Student Model class' attributes like in Figure
394 4.2:

```
class Student(models.Model):
    student_id = models.IntegerField(primary_key=True)
    first_name = models.CharField(max_length=100, default='')
    last_name = models.CharField(max_length=100, default='')
    email = models.EmailField(null=True)
    face_data = models.TextField(null=True)

    Codeium: Refactor | Explain | Generate Docstring | X
    def full_name(self):
        return f'{self.first_name} {self.last_name}'
    Codeium: Refactor | Explain | Generate Docstring | X
    def __str__(self):
        return self.full_name()
```

Figure 4.2: Student model

395 SQL equivalent would be:

```
396 CREATE TABLE Student (
397     student_id INTEGER PRIMARY KEY,
398     first_name VARCHAR(100) NOT NULL DEFAULT '',
399     last_name VARCHAR(100) NOT NULL DEFAULT '',
400     email VARCHAR(254),
401     face_data TEXT,
402     CONSTRAINT unique_email UNIQUE (email)
403 );
404
```

405 4.2.2 REST API by Django Ninja

406 Figure 4.3 is the automatic OpenAPI compliant documentation provided by Django
407 Ninja. It contains all endpoints we can use to query data from the database. All
408 endpoints are protected using HTTP Bearer token authentication.

Authorize

| GET | /api/attendance/recent | Get Recent Attendance |
| Student API | | |
| POST | /api/student/register | Register Student |
| GET | /api/student/all | Get All Students |
| DELETE | /api/student/{student_id} | Delete Student |

Figure 4.3: API Documentation

4.2.3 Admin panel by Django

Figure 4.4 is the Django administration page only accessible to a superuser account. This is where most of the backend maintenance work happens. It contains all the data inside the database allow full control over them. It also contains every authentication tokens used by each teacher account.

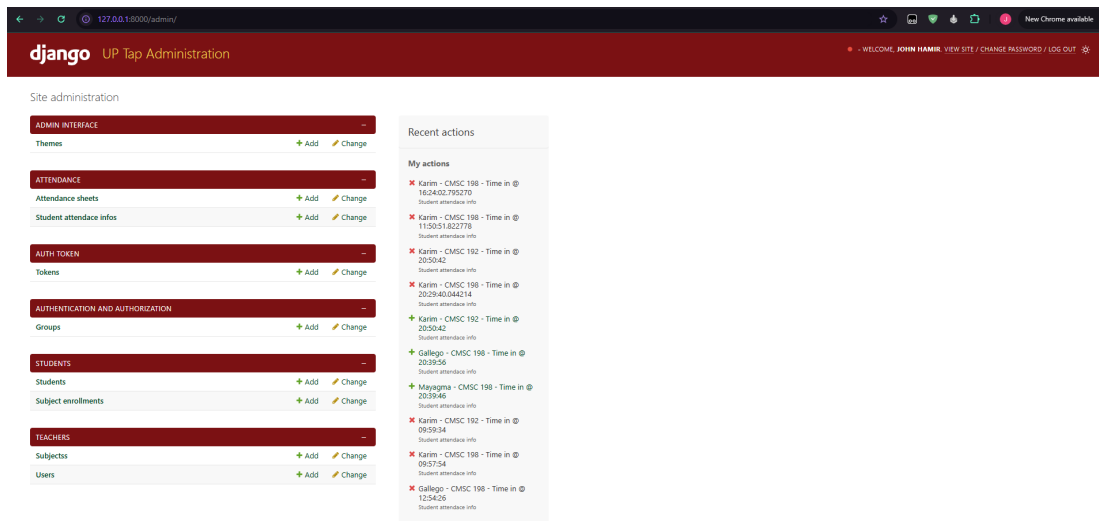

Figure 4.4: Django Administration

4.3 Nuxt Frontend

With the backend handling most of the heavy work, the frontend only needs to capture images from the camera and sending them to the backend to verify student identity. The localhost:3000/dashboard/time-in-out page handles the time in and time out process. The RFID input is automatically highlighted upon opening

The image shows a web application interface for 'UP Tap Attendance System'. At the top right, there is a dropdown menu showing 'CMSC 198'. Below this, there are two buttons: '1. Time in' (highlighted in red) and '2. Time out' (greyed out). The main area is divided into two steps:

- Step 1: Face Recognition**: This section contains a video feed of a person's face. Below the video, it says 'Align your face with the camera, please.'
- Step 2: RFID Scan**: This section contains an illustration of a hand holding an RFID card over a scanner. The scanner has a label that says 'TAP YOUR CARD' and a circular icon with three curved lines representing the scanner's field. Below the illustration is a text input field with the placeholder text 'Scan your RFID card...'.

Figure 4.5: Time in and Time out Page

the page so it will be immediately ready to take in input from the RFID scanner. When the proper number length is inputted, it will immediately start to verify the identity. It will then notify the student for the time in/time out time and status. It will also notify for any errors like spoof image or no face detected. From our testing, the response time is currently at most 2.3 seconds, most of the delay comes from the fake delay we used to allow the student to read the notification after verification.

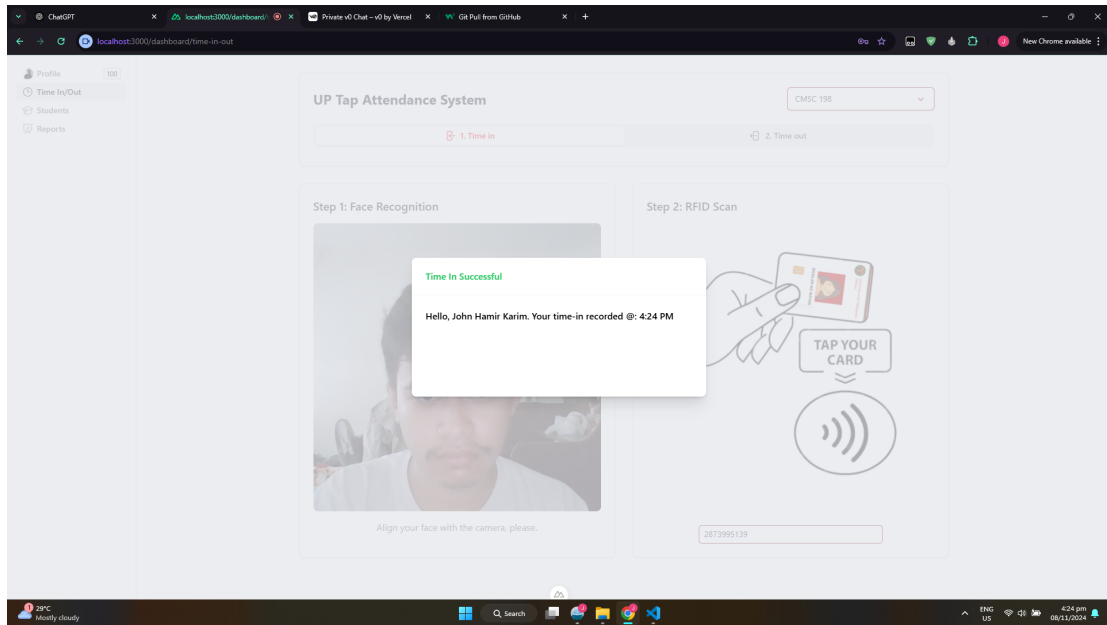

Figure 4.6: Successful Time In

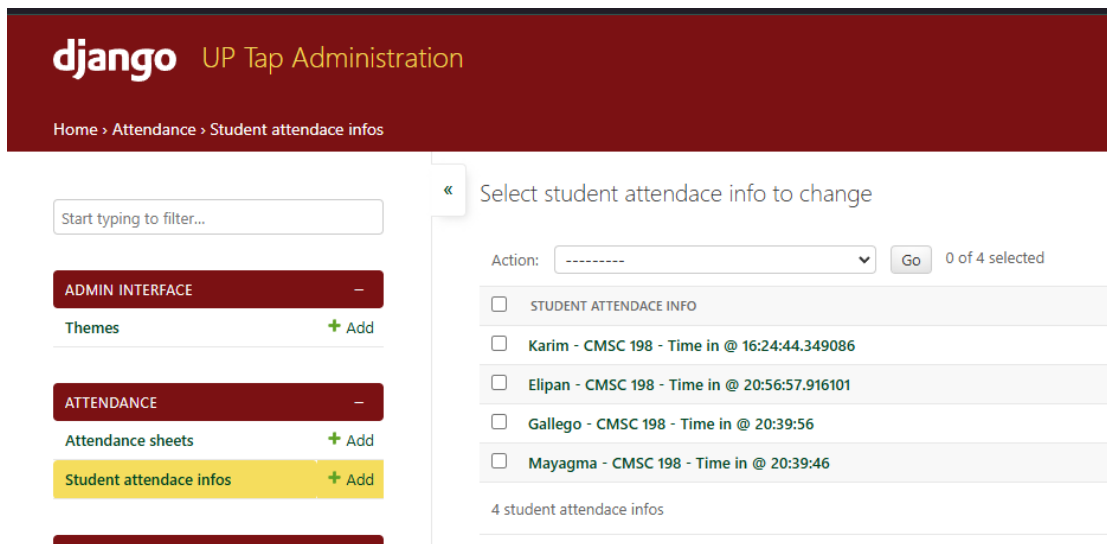

Figure 4.7: Django saving the attendance time instance in 24-hr format

```
if(time_in){  
  openModal(time_in)  
  // 2 second countdown  
  setTimeout(() => {  
    closeModal()  
  }, 2000);  
  setTimeout(() => {  
    rfidRef.value.$refs.input.focus()  
  }, 2300)  
}
```

Figure 4.8: Fake Delay
